Manual
Furlex Electric 200 E & 300 E
1 Introduction

1.1 Instructions

In order for you to gain the most benefit and enjoyment from your Furlex Electric system, we recommend that you study these instructions thoroughly. The instructions also contain advice about equipment that is not included in the Furlex Electric basic kit, i.e. cables, fuses, etc. We therefore recommend that these instructions be read before purchasing additional material and the installation work is started.

The instructions are divided into three main sections:
• ELECTRICAL INSTALLATION IN THE BOAT
• RETROFITTING A MOTOR UNIT ON AN EXISTING FURLEX
• OPERATIONAL INSTRUCTIONS

For installation of the furling system only (Forestay, extrusion and bearing assembly) on boats and rigs, follow specific parts from instruction 595-104-S for manual Furlex 200 S & 300 S or 595-231-S for manual Furlex 200 TD & 300 TD. It is very important that the instructions are read and implemented.

EF in the margin indicates that the information is specific for retrofitting on an EXISTING FURLEX

NF in the margin indicates that the information is specific for installation of a completely NEW FURLEX-E including forestay, extrusion and bearing assembly.

TD in the margin indicates that the information is specific for retrofitting on a FURLEX-TD i.e. Seldén’s Furlex for below-deck installation.

All safety-related information is indicated by the following symbol: ⚠

The instruction includes and refers to two different Furlex-sizes, 200 E and 300 E respectively. This designation can be found on the motor unit.

All dimensions specified in the instructions are in millimetres (mm) unless otherwise indicated.

⚠ The information in this instruction must be followed without exception to avoid breakdowns and the risk of personal injury.

The 2-year guarantee on the Furlex Electric system is only valid if the system is assembled and operated in accordance with these instructions.

⚠ Read all the instructions before installing.

Seldén Mast AB’s guarantee for Furlex Electric-parts is 2 years. The guarantee applies to faults caused by Seldén Mast AB, arising through faulty construction, material or work.

The guarantee applies only if the Furlex system has been installed, operated and maintained in accordance with this instruction and has not been exposed to greater loads than those given in the brochure and instruction material.

If the system is repaired by anyone other than Seldén Mast AB or one of our authorised dealers, the guarantee ceases to be valid.

Seldén Mast AB reserves the right to alter the content and design without prior warning and maintains the right to future design changes.

1.2 Product information

Seldén has manufactured the Furlex furling foresail system since 1983. Furlex quickly became the market leader, a position it still occupies today due to further development of the self-furling foresail concept. Our current production includes, in addition to the basic model Furlex S (controlled from the cockpit via a line), Furlex H (hydraulic controls) and Furlex TD for below-deck installation, (Through Deck).

The latest addition to the Furlex-collection is Furlex E (Furlex Electric) and Furlex TDE (Through Deck Electric).

In addition to the success we have had in creating a powerful, reliable product for new boats, we are now proud to offer owners of the older Furlex S-system, (from 1997), an easy upgrading to electrical operation. This also means that a customer who buys a boat sometime in the future that is equipped with a manual Furlex (Furlex S) can later easily upgrade it to electrical operation.

When we developed Furlex Electric we had the following criteria in focus:

- **Powerful** It should be able to furl a sail in really hard wind conditions.
- **Simple construction** Easy to install and perform service on
- **Compatible with Furlex S** Should fit on existing manual systems. (from 1997)
- **Reliable** A minimum number of components in both the mechanical and electrical design.
- **Cost-effective** A well thought out, high quality product at an acceptable price.

It has always been our intention to retain responsibility for our products through all stages of supply. Furlex Electric is therefore only sold through local, authorised dealers who can satisfy all of our customers requirements. These can assist with advice, installation help and service.

Furlex Electric is supplied as a basic kit for most boats. There are a number of accessories for adaptation of the equipment, such as remote control, fuses, etc.

Furlex is developed and manufactured by Seldén Mast AB, the world’s leading manufacturer of masts and rigging systems. Our range of products consists of self-furling systems for a large number of boats, from dinghies to 80 foot displacement boats.

We wish you fine sailing with your Furlex Electric.

25. Tack ring
26. Deck collar
27. Lower bearing assembly
28. Fork termination

Furlex TD

Fig. 1.2

Lower bearing assembly + Motor unit = Drive unit
1.3 Product description

The Furlex Electric drive unit consists of the motor unit together with the lower bearing assembly. The electric motor is supplied with power and controlled via the control box. The main parts of the system are shown in fig 1.2.

Motor unit

The motor unit consists of a cast and machined aluminium housing. The motor housing is anodised before painting. The motor unit contains an electric motor that drives a reduction gear via a belt. The reduction gear in turn drives the lower bearing assembly, and thereby the sail extrusion, via one or two flanges.

Technical data for the motor unit:

<table>
<thead>
<tr>
<th>Furlex Series</th>
<th>Drive ratio (reduction and belt drive)</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 E</td>
<td>53.4:1</td>
</tr>
<tr>
<td>300 E</td>
<td>60.8:1</td>
</tr>
</tbody>
</table>

IP-class motor unit IP57. (Does not include water entry via the open end of the cable protection sleeve).

The rotational speed of the sail extrusion at different loads can be read from diagram 1.3.a-1.3.c.

Electric motor

The electric motor is a DC brush motor with permanent neodym-magnets. The direction of rotation is changed by switching polarity with a relay in the control box. In the Furlex application, the motor is operated above its nominal power output for short periods of time.

The electric motor is located within the starboard cover lid. The stainless steel cover lid is sealed with gasket silicon. The electric motor is protected from overheating by a protective current limitation function in the control box, the function disconnects the power to show that the motor is overloaded. This function is described more completely under “Control box” later on in chap. 1.3.

Technical data for the electric motors:

<table>
<thead>
<tr>
<th>Furlex Series</th>
<th>Voltage (V)</th>
<th>Nominal power (W)</th>
<th>Speed (unloaded) (rpm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 E</td>
<td>12</td>
<td>220</td>
<td>2330</td>
</tr>
<tr>
<td>300 E</td>
<td>24</td>
<td>450</td>
<td>2150</td>
</tr>
</tbody>
</table>

Current consumption at different loads can be seen in diagram 1.3.a-1.3.c.

Belt drive

The belt drive is within the port cover lid. It comprises two toothed aluminium pulleys and a belt made from composite material. The stainless steel cover lid is sealed with gasket silicon.

Data for belt drive:

<table>
<thead>
<tr>
<th>Furlex Series</th>
<th>Drive ratio (belt drive)</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 E</td>
<td>1.78:1</td>
</tr>
<tr>
<td>300 E</td>
<td>1.52:1</td>
</tr>
</tbody>
</table>

Reduction gear

The reduction gear comprises a worm and a pinion. The end of the worm can be seen on the starboard side, it has a 1/2” socket to allow emergency furling. The worm shaft is made from corrosion resistant stainless steel and the threaded part of hardened steel. The worm is supported in the housing on two angular-contact bearings.

The pinion is made from bronze and is supported in the motor housing. The bearing has an external aluminium bearing race and torlon balls.

On delivery, the reduction gear is packed with ball bearing grease. The worm and pinion are sealed with grease seals.
The reduction gear is self-locking. This means that the sail is prevented from unfurling, however hard the sheet load is.
Refer to chap. 8 for service of the motor unit/reduction gear.

Data for reduction gear:

<table>
<thead>
<tr>
<th>Furlex Series</th>
<th>Drive ratio (reduction gear)</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 E</td>
<td>30:1</td>
</tr>
<tr>
<td>300 E</td>
<td>40:1</td>
</tr>
</tbody>
</table>

Torque, current consumption and rotational speed
The torque on the drive unit output shaft (extrusion), current consumption and rotational speed of the extrusion can be seen for Furlex 200 E and 300E in diagram 1.3.a-1.3.c. The loads of 60 and 90 Nm correspond to furling in very hard weather or when the sheet is insufficiently slack. In “normal” conditions, the drive unit works at 20 to 30% of its maximum capacity.

⚠️ For cable dimensions, refer to table 4.9.c.

Control box
The Furlex Electric is connected to and is controlled from the control box. The box is available in 12 V or 24 V versions. Class IP65. The box is intended for installation under deck, not in the anchor box.
It contains the following functions:
- Connection points for the power cables
- Connection plinths for the control cables
- Polarity alternating relay
- Current limiting function
- Fuse for control current. Type: Glass tube fuse (Ø 5x20) 3.15 A
- Connection plinth for remote control (Remote control can be purchased as an option)
The current to the motor is limited electronically by the control box. The two potentiometers (R) and (B) on the electronics board are set to the correct value for the motor in question at delivery and are sealed with yellow tape. The blue pot. (B) controls the current value. The red pot. (R) determines how long this current is permitted before the current is cut.

At 110 A 12 V (75 A 24 V) the current will be cut within 1 sec, independent of the values set on the two potentiometers. Such high currents can occur if one does not slacken the sheet when furling.

When the IN or OUT button is released, the current protection is reset automatically after a few seconds. One can now continue furling/unfurling, but has received a warning that the load is too high.

---

**The current limitation value (potentiometers) are set at delivery and shall not be adjusted.**

---

The current limitation also functions as a fuse if a short-circuit should occur between the control box and the motor.

**Connection box**

The connection box is the dividing point between the drive unit and the boat, it is intended for installation in the anchor box. When removing the drive unit from the boat, disconnect the motor cables from the connection box plinth. Class IP65.

**Wireless remote control (option)**

Furlex Electric can be equipped with wireless remote control as an accessory. In addition to the remote hand unit, an extra circuit board with control electronics is required (receiver board). This easily mounted in the control box. The hand unit (transmitter) is equipped with a button panel for a total of four on/off functions (8 buttons). Controlling a Furlex Electric occupies one of these functions (2 buttons). There are therefore an additional three on/off functions remaining for other equipment onboard. E.g. electric or hydraulic furling mast, hydraulic boom hauler, anchor winch, etc. For each of these additional functions, an additional circuit board will be required.

The hand unit is powered by one battery, type 4LR44.

Class IP65. (impervious to flushing and rain but not submersible)

For order no., see chap. 2.4.
# INSTALLATION

## 2 Check list

### 2.1 Check list for:

- Furlex E complete system with extrusion kit
- Furlex E for retro-fitting on existing Furlex S
- Furlex TDE complete system with extrusion kit
- Furlex TDE for retro-fitting on existing Furlex TD

3 Assembly preparations

3.1 Forestay attachment – Main rule

The main rule is that the forestay and all its connections shall be flexibly jointed in all directions. In most cases, a toggle shall be fitted between the Furlex stay and the forestay attachment.

3.2. Connection to the deck

Existing Furlex-systems are equipped with a fork toggle as standard. This must be replaced by the stronger toggle included in the kit. If an extension link is used, this should also be replaced by a stronger type. See table 3.2.4.

Check that the boat’s forestay attachment is strong enough to take up the torsional forces from the Furlex-E. Since there is no furling line to take up the torsional forces when, e.g. sailing with a reefed foresail, all of the torsional forces will be taken up by the drive unit and be transferred via the toggle and any extension link to the boat’s forestay attachment. See table 3.2.1 for minimum torsional strength.

<table>
<thead>
<tr>
<th>Furlex Series</th>
<th>Maximum torque on the forestay attachment (Max Service Load) (Nm)</th>
</tr>
</thead>
<tbody>
<tr>

<td>Rigg-type</td>
</tr>
<tr>
<td>200 E</td>
<td>95</td>
</tr>
<tr>
<td>300 E</td>
<td>xxx</td>
</tr>
</tbody>
</table>

The torque is transferred to the forestay attachment via the width of the toggle (B). If the forestay attachment is too light weight, it can be locally deformed. Even if the attachment to the boat itself can handle the maximum stated torque.

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td></td>
<td>6 mm wire</td>
</tr>
<tr>
<td>200 E</td>
<td>32</td>
</tr>
<tr>
<td>300 E</td>
<td>xxx</td>
</tr>
</tbody>
</table>
The strength can be theoretically calculated or found via practical tests. If the chainplate is not sufficiently strong, there are four threaded holes on the underside of the motor unit to which a torque absorber can be fitted. This must be individually adapted for the boat in question and is therefore not supplied by Seldén.

### 3.2.1 Dimensions of drive unit, deck fitting

</tbody>
</table>

* The dotted lines show emergency furling fitted. The figure shows Furlex 200 TDE.

Table 3.2.2.a
The black collar (fig. 3.2.2.b) on the 300 TD-model motor unit is chamfered to achieve an F-measurement of 20 mm, see table 3.2.2.a.

### 3.2.3 Toggles and extensions

If the boat is fitted with a bow anchor, it may be necessary to raise the drive unit to allow clearance for the anchor. High-strength extension links are available as accessories, see table 3.2.4. The links have the same length (H) as the corresponding links on Furlex S.

If the lower drive unit is raised by using extension links or similar. Then the Furlex-toggle, or corresponding with the same function, shall be mounted between the extension link and the boat’s forestay attachment.

An extended toggle does not give the required flexibility. It must always be connected to the boat’s forestay attachment via a toggle.

Make sure that the toggles’ split pins are secure after installation, see fig. 3.2.3.b.

Ensure that the torsional strength of the boat’s forestay attachment is sufficient and that the correct toggle is used.
3.2.4 Dimensions and data for toggles (Toggles can be supplied by a Furlex dealer)

Table 3.2.4

3.3 Anchor box drainage

Make sure that the draining hole for the anchor box is sufficiently large to prevent water being dammed up in the box if the boat dives in high seas. This is especially important for Furlex TD Electric, since the motor unit is fitted further down in the anchor box. If the anchor box fills up with water, this could damage the motor unit.

On some boats, the anchor box cover has a hole for the chain shaped like a “letterbox”. This hole can allow large amounts of water to enter if the boat dives in high seas.

Tip: Fasten a piece of foam to the cover. Make a hole for the chain. This reduces the water flow considerably.

⚠️ Make sure that the anchor box is well drained and does not risk being filled with water.
4 Electrical installation in the boat

4.1 Cables and components

Fig. 4.1 is an overview drawing of a typical electrical installation for a Furlex Electric. All components and cables (C1-C6) are shown and referred to in the text in this and following chapters. The cable sizes are described in chap.4.9.
4.2 Wiring diagram

**Fig. 4.2**
4.3 Planning the electrical installation

Check that the boat’s existing battery capacity is sufficient. If extra batteries are required, their location must be carefully considered. See chap. 4.5.

To extract the best effect from the system, it is necessary to minimise the unavoidable voltage drop that occurs between the battery and the drive unit.

1. Minimise the distance between the battery and the drive unit. Make especially sure that the distance between the drive unit and connection box is kept to a minimum. The wires that come from the motor (C3) have a smaller cross-section and add to the voltage drop.

2. Follow the recommended cable dimensions. See table 4.9.c.

3. Make sure you use cable terminations that provide a good contact surface when connecting up. We recommend crimped cable terminations. Connections in the connecting box are via DIN rail plinths.

4. Tinned conductors are recommended.

If a common supply cable is to be use to provide for more functions than the Furlex Electric with power (e.g. anchor winch and bow propeller) the following must shall be taken into consideration:

1. Cables, fuses and battery capacity must be dimensioned so that all functions can be operated simultaneously. Alternatively, a separate control function can be fitted to ensure that only one function can be operated at a time. (Contact your boat electrician for this)

2. Feeds from the supply cable to the various functions must be via the connection box.

3. The control box must be mounted after the connection box.

4. An existing fuse (mounted between the battery and connection box) provides short-circuit protection for cable C1, assuming the fuse does not exceed the value in table 4.9.a, when the cable cross-section corresponds to C1. If the existing fuse is too large, see fig. 4.9.b.

4.4 Control box

The control box should be mounted in a dry and easily accessible position on a bulkhead below deck, so that the cover can be removed easily for inspection. Also consider that the position should not make the cable run from the battery to the control box unnecessarily long.

The control box is mounted upright with the cable entries at the bottom.

Box dimensions; H=250, W=180 Depth=105.

The control box has a current protection circuit that cuts the power if the motor becomes overloaded, or if a short-circuit occurs between the control box and the motor. This protection is reset automatically a few seconds after the IN or OUT buttons are released. The protective circuit is correctly adjusted at delivery. The function is described in more detail in chap. 7.2 and in chap. 1.3 under heading “Control box”.

Connect the cables according to fig. 4.4.b and wiring diagram fig. 4.2.
The power cables (C1, C2) are fitted with cable lugs for the intended cable dimension and with a Ø8 mm bolt hole. The signal cables (C4, C5) are connected to the plinths in the box.

Control current is taken internally from the box via a 3.15 A glass tube fuse, which is located in a holder on the green circuit board inside the control box. See fig. 4.4.c.

### 4.5 Battery

Avoid using the engine starter motor battery. To minimise the voltage drop, the battery capacity for a Furlex 200/300 E 12V should be at least 115 Ah and for a Furlex 300 E 24V at least 60 Ah. Connection to the battery should always be via a fuse and battery isolator.

⚠️ **Connection to the battery should always be via a fuse and battery isolator!**
4.6 Connection box

The connection box is the dividing point when Furlex Electric drive unit is to be removed from the boat. See fig. 4.6.a.
The connection box is usually mounted in the anchor box. Position the box in such a way that the cover can easily be removed and the cables C3 released. Also try to fit it as close as possible to the deck collar, where the cables C3 come from the Furlex.
The cables (C2) from the control box should never need to be undone. The cables (C3) between the connection box and deck collar must be installed below deck. A piece of plastic conduit can be positioned there to protect and hold the cables in place. This will make it easier to remove the cables when the drive unit is removed from the boat.

The connection box is fitted with DIN-rails for connection plinths. The plinths allow a maximum cable cross-section of 35 mm².

Connection box dimensions, incl cover; LxWxH=130 x 130 x 77 mm.

1. The C2 cables are stripped 12 mm and clamped in place. Tighten securely.
2. The cables C3 are to be stripped 12 mm and fitted with conductor collars (provided), crimped, and then fitted to the connection plinths. Tighten securely. When the cables are loosened at a later date, the collars will remain on the cables.
3. Tighten the cable feed-throughs so that they tighten around the cables.

4.7 Control functions

4.7.1 Description

The Furlex Electric can be controlled via the fixed control buttons and/or via a wireless remote control. We recommend that you always install the fixed control buttons, even when you use the remote control.

☐ Furlex Electric is supplied with or without control buttons, depending on the order number. Seldens control buttons have built-in lighting are are marked “GENOA IN” and “GENOA OUT”.

Other types of closing-contact push buttons of high quality can also be used.

☐ It must be possible to disconnect the control current (See chap. 4.7.3).

☐ It must be possible to disconnect the button lighting (See chap. 4.7.4).

☐ A wireless remote control is available as an accessory. (See chap. 4.8).
### 4.7.2 Control buttons

The fixed control buttons should be mounted so that they are accessible for both the helmsman and the crew, at the same time as the furling-genua sheet can be handled. The operator must also have a view of the furling system to ensure correct furling of the sail.

It is also possible to purchase and install double control button sets, to install on both starboard and port sides. (Order no., see chap. 2.4).

---

**The operator must have a view of the operation of the furling system, to ensure correct furling/unfurling of the fore-sail.**

---

**Installing the control buttons:**

Seldén control buttons can be installed directly in the boat’s laminate, or be complemented with a stainless button panel. These are available for one or two control buttons. See fig. 4.7.2.b. (Order no., see chap. 2.4).

When correctly installed, Seldén's push buttons fulfil electrical class IP67.

1. **When installing directly in the boat's laminate:**
   - The seal between the button and the laminate is achieved by using the O-ring that is supplied with the button, see fig. 4.7.2.a. To ensure a proper seal, it is important that the fitting hole is not too large. Use a Ø 30 mm hole saw.

   ![Fig. 4.7.2.a.](image)

2. **When installing in Seldén's button panel, either single or double type:**
   - Mount the button in the stainless panel.
   - Use a Ø 37 mm hole saw to make space in the laminate. Put the button panel in position and drill the screw holes. Use the panel as a template.
   - Final assembly of the button panel is sealed with Sikaflex or similar against the laminate. The seal between the button and panel is via the O-ring.

   ![Fig. 4.7.2.b](image)
3. Connect the control buttons to cable C4. Follow the wiring diagram, chap. 4.2. Seldéns buttons are supplied with the necessary spade connectors (size 2.8x0.5). See fig. 4.7.2.c. If Seldéns 7-conductor cable is used, use the grey, yellow and green wires for control and the blue and pink wires for button lighting. See the wiring diagram for more details, chap. 4.2.

![Fig. 4.7.2.c](image)

If the luff extrusion rotates in the wrong direction when pressing the IN and OUT buttons, reverse cable C3’s wires in the connection box, see fig. 4.7.2.d. Avoid switching the signal wires on the plinth in the control box, as this would cause IN and OUT not to correspond with the buttons on a remote control.

![Fig. 4.7.2.d](image)

**4.7.3 Control current switch**

It must be possible to disconnect the control current. For the purpose of safety, we recommend a 1-pole toggle switch close to the control buttons (ALT. 1, see wiring diagram, chap. 4.2). The switch should be protected against splashing and unintentional operation, e.g. in a cockpit side pocket. Disconnecting the control current prevents unintentional operation of the Furlex Electric, both from the fixed control buttons and any remote control (extra accessory).

An alternative to placing the control current switch in the cockpit is to mount it on the boat’s control panel in the saloon (ALT. 2, see wiring diagram, chap. 4.2).

The toggle switch is not supplied with the Furlex Electric kit but is available as an accessory. Order no., see chap. 4.2.

![Disconnecting the control current prevents unintentional operation of the Furlex Electric.](image)

**Connecting the control current switch:**

If Seldéns 7-conductor cable is used, use the brown and white wires in cable C4 if connection is made according to ALT.1.

(ALT. 2; Brown and white wires in cable C5.) See the wiring diagram for more details, chap. 4.2.

**4.7.4 Button lighting switch**

It should also be possible to switch the internal lighting of Seldéns control buttons on or off. We suggest that the switch is located on the boat’s electrical centre. Use a spare switch or add another 1-pole switch of the same type as the existing switches on the panel.

**Connecting the switch for button lighting:**

If Seldéns 7-conductor cable is used, use the pink and green wires in cable C5. See the wiring diagram for more details, chap. 4.2.
4.8 Wireless remote control

Furlex Electric can be equipped with wireless remote control as an accessory. In addition to the remote hand unit, an extra circuit board with control electronics is required (receiver board), to be mounted in the control box. The hand unit (transmitter) is equipped with a button panel for a total of four on/off functions (8 buttons). Controlling a Furlex Electric occupies one of these functions (2 buttons). There are therefore an additional three on/off functions remaining for other equipment onboard. E.g. electric or hydraulic furling mast, hydraulic boom outhaul, anchor winch, etc. For each of these additional functions, an additional circuit board will be required. Order no., see chap. 4.2.

![Image](Fig. 4.8.a)

Each receiver card can handle one function e.g. IN and OUT.

![Image](Fig. 4.8.b)

The hand unit (transmitter) can handle four receiver cards.

4.8.1 Mounting receiver card in control box

1. Disconnect the control power to the control box.
2. Remove the cover from the control box.
3. Bend the aerial according to fig. 4.8.1.a.
4. Fasten the two cable ties 1 and 2 close to the end of the aerial, according to fig. 4.8.1.b.

![Image](Fig. 4.8.1.a)

![Image](Fig. 4.8.1.b)

5. Press the board in place on both pin connectors according to figs. 4.8.1.c and 4.8.1.d.

![Image](Fig. 4.8.1.c)

![Image](Fig. 4.8.1.d)

6. Attach the end of the aerial with cable ties, as shown in fig. 4.8.1.b. Make sure that the aerial remains clear of the other components in the box. Bend to adjust it if not.
7. Reconnect the control power.
8. Program according to chap. 4.8.2.

4.8.2 Programming the remote control

Simple programming is required to assign which buttons on the hand unit are to control a certain function (receiver board). This applies to either the hand unit delivered with the Furlex-unit, or one acquired at a later date.

1. Check that the control power is switched on and then open the cover on the control box.
   The receiver board must be in place as described in the previous chapter.
2. There is a red pushbutton beside the glass fuse on the larger circuit board with a yellow LED beneath it. Hold the pushbutton in until the LED lights continuously (yellow). Release the button.

3. Select a button-row on the hand unit and within three seconds press on either the OUT or IN button. Programming is completed.

4.8.3 Un-programming the remote control

To re-program the electronics in the control box so that it reacts to another button row, the board must first be un-programmed.

1. Hold the red pushbutton in until the yellow LED starts flashing (about 5 sec interval). The board is now un-programmed and will not react to the hand unit’s buttons.

2. Re-program it again according to points 1 to 3, chap. 4.8.2.

4.8.4 Replacing batteries, hand unit

The remote control hand unit is powered by one 6 V battery, type 4LR44.

The nominal life of the battery is about 25 operating hours, i.e. it can perform about 2000 operations of about 45 sec. The battery can self-discharge if the remote control is not used for a longer time, so a battery change is recommended before each season. A spare battery should be kept onboard.

To replace the battery, undo two screws holding the battery cover in place. There is an O-ring in a groove in the cover. Make sure the O-ring is properly located when refitting the cover.

In order for the remote control (receiver) to function, the control current switch for the control box must be ON.

Even when the remote control is used, it is recommended to install the fixed control buttons.
**4.9 Cables**

The components in the Furlex Electric system are connected by cables C1-C6. See wiring diagram, chap. 4.2.

**Cables C1 and C2 (not supplied)**
Cable C1 provides the control box with power from the battery.
Battery cables are used here, two single conductors, e.g. black (-) and red (+). Tinned conductors and crimped cable lugs are recommended. The cable lugs for connection to the control box should have M8 bolt holes drilled.

Connection to the battery shall always be via a fuse and battery isolator (on the plus cable).
The fuse provides short-circuit protection for cable C1 and should be mounted close to the battery isolator/ battery.
The main fuse is not supplied with the Furlex Electric kit but is available as an accessory. Order nr., see chap. 2.4.

**Minimum fuse capacity (independent of cross-section; C1) Furlex 200/300 E 12V = 125 A**
**Minimum fuse capacity (independent of cross-section; C1) Furlex 300 E 24V = 60 A**

Existing fuses that meet these requirements can be used. They must not exceed the values in table 4.9.a.

<table>
<thead>
<tr>
<th>Cable cross-sectional area</th>
<th>Max. fuse</th>
<th>Applies to cable</th>
</tr>
</thead>
<tbody>
<tr>
<td>16 mm²</td>
<td>160 A</td>
<td>C1</td>
</tr>
<tr>
<td>25 mm²</td>
<td>200 A</td>
<td>C1</td>
</tr>
<tr>
<td>35 mm²</td>
<td>315 A</td>
<td>C1</td>
</tr>
</tbody>
</table>

*Table 4.9.a*

The maximum fuse size is dependant on the cross section of cable C1. See table 4.9.a.
If the existing fuse is too large, a new fuse must be fitted directly after the cable C1 is spliced into the main cable. See example in fig. 4.9.b.
(It would, however have been perfectly possible to splice in a 25 mm² cable without fitting an additional fuse since it would have sufficient short-circuit protection via the existing 200 A fuse.)

Cable C2 connects the control box with the connection box. The same type and dimension of cable as for C1 is used here.
To minimise the voltage drop, the total length of C1 + C2 should not exceed the values in table 4.9.c. The cable length is defined as the length of one of the two conductors, i.e. either the plus or minus cable, see fig. 4.9.d.

<table>
<thead>
<tr>
<th>Cable cross-sectional area</th>
<th>Max. cable length C1+C2 12V</th>
<th>Max. cable length C1+C2 24V</th>
</tr>
</thead>
<tbody>
<tr>
<td>16 mm²</td>
<td>3.8 m</td>
<td>8 m</td>
</tr>
<tr>
<td>25 mm²</td>
<td>6 m</td>
<td>12 m</td>
</tr>
<tr>
<td>35 mm²</td>
<td>8 m</td>
<td>16 m</td>
</tr>
<tr>
<td>50 mm²</td>
<td>12 m</td>
<td>24 m</td>
</tr>
</tbody>
</table>

*Table 4.9.c*
Cable C3
Cable C3 is permanently attached to the drive unit (black and red wires). For Furlex 200 E the cable cross section is 6mm² and for Furlex 300 E 16 mm². The wires are about 2 m long at delivery but should be kept as short as possible when installing. I.e., the connection box should be placed below deck, as close to the deck collar as possible. The length of the cables must not exceed 1.5 m, (for a 12V system, preferably shorter), to reduce the voltage drop.

Cable C4
The Furlex Electric kit includes 15 m of tinned, colour-coded multi-wire cable, 7 x 0.75 mm². Three wires are required for the control buttons, two wires for the internal button lighting and two wires to disconnect the control current to the control box (position ALT. 1).
The included cable can also be used as cable C5. For additional lengths of this cable, see chap. 4.2.

Cable C5
Cable C5 requires 4 wires x 0.75 mm². Two wires are used to turn the internal button lighting on/off. The other two are used to disconnect the control current (with location as ALT. 2). With ALT.1, a two-wire cable is sufficient. See the wiring diagram for more details in chap. 4.2.
Use part of the tinned, colour-coded cable, 7 x 0.75 mm², which is supplied with the Furlex Electric kit.
For additional lengths of this cable, see chap. 4.2.

Cables C4 and C5 (control circuit) are fused internally in the control box with a 3.15 A fuse. Concerning the type of fuse, see chap. 1.3 under “Control box”.

Fig. 4.9.d
5. **EF** Installation of motor unit on existing lower bearing assembly

**EF** applies to all of chap. 5.
The drive unit and its major parts are named in accordance with. fig. 5.a.

In order to install the motor unit on an existing lower bearing assembly, we recommend that the latter is removed from the Furlex system. This can be done relatively simply if the Furlex system is removed from the boat. This is described in chap. 5.2 - 5.8. Alternatively, the work can be performed on a rigged extrusion/profile. Note however, that installation of the motor unit on the lower bearing assembly will be more awkward with this method. This alternative is described in chap. 5.9 - 5.12.

For both methods, the sail must be removed from the Furlex system.

5.1 Checking the motor unit
1. Temporarily connect the motor unit to the connection box.
2. Activate the power supply from the battery to the control functions.
3. Test run both IN & OUT functions.
4. If the functions are OK; remove the cables from the connection box. If not, fault trace according to "Fault tracing diagram", chap. 9.

5.2 Removal of the Furlex system and disassembly

5.2.1 Sail feeder

Undo the sail feeder:

1. Fig. 5.2.1.a
   - Secure the stainless sail feeder with a piece of tape so that it does not fall overboard during removal.

2. Fig. 5.2.1.b
   - Undo the screws.

3. Fig. 5.2.1.c
   - Lift out the sail feeder and lever off the connecting piece.

Refitting the sail feeder:

4. Fig. 5.2.1.d
   - Press on the connecting piece from the front edge of the profile.

5. Fig. 5.2.1.e
   - Hook on the sail feeder on the upper edge. Secure with tape. Mount the screws.
**5.2.2 Undo the line guide**

1. Roll off all the line from the line drum.

2. Push a -screwdriver under one of the drum’s ”quick connectors”. Push in another screwdriver between the drum halves on the same side so that these are pressed apart 3-4 mm.

3. Keep the screwdriver in place and turn the stay a half turn. Release the other drum half’s ”quick connection”. Undo the screws.

4. Press in the spring loaded clips (arrow 1) and release the locking block downwards.

5. Pull the line drum guard off the line drum.

**5.2.3 Undo the line drum**

1. Push a -screwdriver under one of the drum’s ”quick connectors”. Push in another screwdriver between the drum halves on the same side so that these are pressed apart 3-4 mm.

2. Keep the screwdriver in place and turn the stay a half turn. Release the other drum half’s ”quick connection”. Undo the screws.

3. The line drum halves can now be removed.
5.2.4 De-rigging

1. Slacken the backstay as much as possible. But make sure that any rigging screw is not unscrewed so far that the threads are no longer visible “on the inside”. For masts with aft swept spreaders, the upper rigging screw must be slackened so much that the forestay can be disconnected. Slacken e.g. the aft stay + one of the upper rigging screws. Count the number of turns the upper rigging screw is slackened. This simplifies reassembly. Avoid changing the setting of any Furlex rigging screws. This simplifies reassembly.

2. Pull the masthead forward using the genoa halyard. Secure the halyard using a "D" shackle or tie it to a strong deck fitting. If the halyard has a snap shackle, this should not be used for reasons of safety.

Always use a strong D-shackle or tie to the halyard.

3. "Go up” in the mast and tie a running line around the Furlex profile with a strong flexible line. Make a double half-hitch in two places about 1 meter from the top. Tape over the knots so that they cannot slip.

4. Loosen the toggle from the deck fitting.

5. Connect the line to a free halyard and tighten so hard that the Furlex-system can be freed from the mast.

6. Lower the Furlex-system while another person watches over the lower part so that it is fed to the side until the whole system is laying on the ground.

5.2.5 Lower bearing assembly

1. Loosen the top guard and pull the halyard swivel off.

2. Mark the position of the extrusion ➀ against the lower bearing assembly’s top with i.e. a lead pencil. This simplifies later reassembly. Undo the screws ⃣ (2 pcs.) that hold the extrusion to the lower bearing assembly.

3. Remove the split pin ⃼ and clevis pin ⃼ that hold the lower bearing assembly to the eye terminal.

4. Move the lower bearing assembly upwards on the extrusion so that the eye terminal is accessible. Place a piece of cloth or paper between the lower bearing assembly and the extrusion to protect against scratching the extrusion. Continue to pull the lower bearing assembly over the top of the extrusion.
5.3 Mounting the motor unit

In order to mount the motor unit to an existing lower bearing assembly, it is necessary to partially disassemble it.

1. Place the lower bearing assembly upside down (preferably in a box, to collect the ball-bearings) and remove the locking ring ① that holds the washer ② and ball-bearings ③ in place. On reassembly, the locking ring will be replaced with a new one from the kit.

2. Remove the washer, balls and bearing race ④. Clean the washer and bearing race for later refitting.

3. Mount the two flanges as illustrated. Note that the longest flange keys should point toward the top of the lower bearing assembly.

4. Turn the motor unit upside down. See fig. 5.3.c. Remove the flange ring and insulating washer. Turn the motor unit right way up.

5. Turn the lower bearing assembly right way up and fed it down into the motor unit. Guide the flange keys into the grooves in the motor unit.

   Due to variations in manufacture, certain older lower bearing assemblies can have a slightly larger outer diameter, which prevents the flange from entering fully. In such cases, remove one of the flanges and try again. 1 flange is quite sufficient to fulfil the function. If this does not work either, then the flange must be modified to a suitable shape with a file.

6. When the lower bearing assembly is in place, the whole unit is then turned upside down. First mount the bearing race. Apply bearing grease (supplied) and then mount the bearing cage with supplied bearings in the grease. Make sure that all the bearings are in place. (Any lost ball bearings can be replaced with old disassembled ball bearings).
Note that the bearing cage ① is conical and that the "narrow" end ② must enter the bearing race ③ (towards the top of the lower bearing assembly).

Fig. 5.3.f

7. Mount the washer and the new supplied locking ring. (never re-use an old locking ring). In order to ensure that the locking ring bottoms, lift the hollow shaft while pressing the locking ring downwards.

Fig. 5.3.g

8. Put the insulation washer in place and remount the flange ring. Undo and remount the 8 screws one by one, apply locking fluid (supplied in the kit) and tighten the screws firmly.

Fig. 5.3.h

5.4 Replacement of existing toggle

Furlex 200 S and 200 E are used for 6.7 and 8 mm wire. Furlex 300 S and 300 E are used for 8 and 10 mm wire. Check that the correct toggle has been delivered with the kit. The part number is stamped on the toggle.

<table>

</tbody>
</table>

Existing Furlexs’ are equipped with a built-in rigging screw or fixed terminal eye. Which ever is fitted, it must be replaced by the supplied high-torque variant. The toggle is mounted with the arrow pointing upwards.

Fig. 5.4.a

Fig. 5.4.b

Fig. 5.4.c
When the toggle is mounted on the chain plate, the maximum number of shims should be placed in between to reduce the play. The toggle is supplied with four 0.8 mm shims. Fit the shims as evenly as possible on each side of the boat’s forestay attachment (e.g. 2+2 or 2+1). Extra shims can be ordered. (Order no., see chap. 2.4).

### 5.5 Drive unit cable collar

The drive unit’s cables must be fed from the drive unit to the deck collar via the supplied protective sleeve. The sleeve has two functions. Partly to protect the cables (C3) from wear and partly to equalize the thrust differences that occur due to temperature variations in the drive unit’s cavity (which is otherwise air tight).

![Fig. 5.5.a](image)

The drive unit has a stainless steel collar from which both motor cables C3 appear. The collar is sealed with an O-ring and can be mounted in 8 different positions, dependant on the most suitable direction for the protective sleeve. (As delivered, it points straight forward). See fig. 5.5.b.

An identical collar must be fitted to the deck (deck collar).

![Fig. 5.5.b](image)

### 5.6 Mounting the deck collar

Once the motor unit is mounted on the existing lower bearing assembly, one can decide where the deck collar should be fitted.

1. Connect the toggle and any extension link to the lower bearing assembly.
2. Adjust the collar on the drive unit for the probable direction, see chap. 5.5.
3. Feed the cables up through the supplied 600 mm long protective sleeve and fit the sleeve over the cable collar on the drive unit. Fix it temporarily with one of the supplied hose clamps.

![Fig. 5.6](image)

4. Connect the drive unit to the boat’s forestay plate and hold it in the direction of the forestay.
5. Lay the protection sleeve in an arc towards the deck collar and mark out the intended position of the deck collar (centre and four screw holes). Note that the sleeve must be arched so that movement of the drive unit can be taken up without the sleeve being stretched. The forestay can move up to 15° during sailing and this movement must also be taken up by the sleeve/cables. Even after the toggle has been shimmed in place, there can still be a certain amount of play. The drive unit will twist a few degrees in one direction or the other, depending on whether the sail is furling or unfurling.

6. Mark the cutting point on the sleeve.
7. **Pull the sleeve off of the cables** and cut to length.
8. Make a hole in the deck for the centre point of the collar. Use a hole saw, Ø 20-25 mm. (If the forestay already is mounted, it may be necessary to disconnect it and move it to one side. Otherwise the drive unit will be in the way of the hole saw).
9. Fig. 5.6 shows an example of mounting the collar and sleeve.
10. Drill holes for the 4 self-tapping screws (L=19 mm, torx T25) which are supplied with the kit. Use drill bit Ø 3.5-4.
11. Apply Sikaflex or similar to the deck collar and screw it in place.

### 5.7 Mounting the drive unit on the luff extrusion

**The mounting sequence (points 1-5) assumes that the setting of the Furlex rigging screw has not been changed when de-rigging the stay/extrusion.**

1. Feed the drive unit on from the top of the extrusion and feed it down to the terminal eye or Furlex rigging screw. Place a piece of cloth or paper between the lower bearing assembly and the extrusion to protect against scratching the extrusion.
2. If a Furlex rigging screw is used, the three flat surfaces of the rigging screw must all be aligned with each other. The lower bearing assembly’s hollow shaft ③ has a corresponding flat surface internally. See fig. 5.7.a. Mount the clevis pin ① and split pin ② which hold the lower bearing assembly’s hollow shaft ③ to both the motor unit’s flange ring ④ and the terminal eye/rigging screw ⑤. Fig. 5.5.a shows the parts in the correct position, seen from below. The direction of the clevis pin mounting depends on if the forestay is oriented for & aft or athwart ships.

![Fig. 5.7.a](image1)

![Fig. 5.7.b](image2)

3. Adjust the extrusion position so that the marks (made during point 5.2.5) coincide with the lower bearing assembly’s upper edge. Mount the two screws ⑥ (fig. 5.2.5.a) in the black plastic adapter and tighten so that they bottom in the forestay extrusion. Loosen the screws one at a time and apply locking fluid to the threads. **Tighten the screws firmly.**
4. Remount the sail feeder according to fig. 5.2.1 points 4-5.
5. Fit the halyard swivel ⑦ fig. 5.7.b. Push it down to the sail feeder and secure in that position with a piece of tape. Remount the top guard as well ⑧. Tighten the screws so that they bottom, but do not overtighten.

![Fig. 5.7.c](image3)
5.8 Remounting the Furlex system on the boat

See Furlex instruction 595-104-S in chap. Rigging. Finally connect sleeve and cables according to points 1-3 below, see fig. 4.6.a.

1. Feed the protective sleeve with the two supplied hose clamps, over the cables C3. Mount the sleeve on the drive unit cable collar. Use a driver with a hex socket intended for hose clamps and tighten firmly.
2. Feed the cables through the deck collar ☮ and then fit the sleeve.
3. Attach the cables below deck. Cut the cables to the correct length and connect to the plinths in the connection box ☪. See chap. 4.6.
4. Check that the supplied emergency furling equipment can be mounted on the starboard side of the drive unit and then remove it again. See chap. 7.6.

⚠️ Test the supplied emergency furling equipment and then remove it again.

⚠️ Before test-running the unit, tie or tape the tack shackle to the extrusion so that the shackle does not strike the drive unit and damage it. Also check that the emergency furling equipment has been removed.
5.9 Alternative mounting of motor unit on existing lower bearing assembly

The description below explains how a Furlex Electric drive unit can be mounted on an existing lower bearing assembly without removing the Furlex system, including the forestay extrusion, from the boat. One does not need to remove the extrusion, but on the other hand, fitting the actual drive unit is more awkward.

**Necessary disassembly**

5.9.1 Undo the line guide

1. Roll off all the line from the line drum.

2. Undo screws ②, and release screw ③ a few turns.

3. Lower the line guide fitting and release it.

![Fig. 5.9.1.a](image1)

![Fig. 5.9.1.b](image2)

4. Press in the spring loaded clips (arrow 1) and release the locking block downwards.

![Fig. 5.9.1.c](image3)

5. Pull the line drum guard off the line drum.
5.9.2 Undo the line drum

1. Slacken the backstay as much as possible. But make sure that any rigging screw is not unscrewed so far that the threads are no longer visible “on the inside”. For masts with aft swept spreaders, the upper rigging screw must be slackened so much that the forestay can be disconnected. Slacken e.g. the aft stay + one of the upper rigging screws. Count the number of turns the upper rigging screw is slackened. This simplifies reassembly. Avoid changing the setting of any Furlex rigging screws. This simplifies reassembly.

2. Pull the masthead forward using the genoa halyard. Secure the halyard using a “D” shackle or tie it to a strong deck fitting. For safety reasons, do not use the halyard snap shackle.

3. The line drum halves can now be removed.

5.10 De-rigging

1. Slacken the backstay as much as possible. But make sure that any rigging screw is not unscrewed so far that the threads are no longer visible “on the inside”. For masts with aft swept spreaders, the upper rigging screw must be slackened so much that the forestay can be disconnected. Slacken e.g. the aft stay + one of the upper rigging screws. Count the number of turns the upper rigging screw is slackened. This simplifies reassembly. Avoid changing the setting of any Furlex rigging screws. This simplifies reassembly.

2. Pull the masthead forward using the genoa halyard. Secure the halyard using a ”D” shackle or tie it to a strong deck fitting. For safety reasons, do not use the halyard snap shackle.

5.11 Lower bearing assembly

1. Mark the position of the extrusion against the lower bearing assembly’s top with i.e. a lead pencil. This simplifies later reassembly. Undo the screws (2 pcs.) that hold the extrusion to the lower bearing assembly.

2. Remove the split pin and clevis pin that hold the lower bearing assembly to the eye terminal.

3. Move the lower bearing assembly up towards the sail feeder on the extrusion so that the eye terminal is accessible. Place a piece of cloth or paper between the lower bearing assembly and the extrusion to protect against scratching the extrusion.

4. Tie the lower bearing assembly’s tack shackle to the halyard swivel shackle.
5. Note in which direction the flat surface of the bearing assembly’s hollow shaft is orientated. Mark the position of the flat surface on the edge of the hollow shaft and on the outside, with a marker pen. See fig. 5.11.c. This simplifies later reassembly.

6. Prepare for removal of the locking ring, washer, balls and bearing race by fixing a "collector" for the bearing balls under the bearing assembly. We suggest a slit plastic box or similar taped in place around the extrusion.

7. Remove the locking ring \( \oplus \) (fig. 5.11.d) holding the washer \( \ominus \) and ball bearings \( \odot \) in place. On reassembly, the locking ring will be replaced with a new one from the kit.

8. Remove the washer, balls and bearing race \( \oplus \). Clean the washer and bearing race for later refitting.

9. Finally remove the existing toggle and any extension link.

**5.12 Installation of motor unit on lower bearing assembly**

1. Prepare the motor unit by removing the flange ring (8 pcs socket head screws) and plastic insulation between the flange ring and motor unit. See fig. 5.3.c. Fasten a rope around the motor unit to take its weight during the installation process.

2. Fit the two flanges \( \oplus \) in place on the lower bearing assembly. Note that the longest flange keys \( \odot \) should point toward the top of the lower bearing assembly.

3. Feed the motor unit over the lower part of the extrusion and then up past the lower bearing assembly, and align the flange keys in the grooves in the motor unit’s bronze gear.

4. Hang up the motor unit using the previously fitted rope.

5. Then fit the bearing race.

6. Mount the washer \( \ominus \) and the new supplied locking ring \( \odot \). (Never re-use an old locking ring). In order to ensure that the locking ring bottoms, lift the motor unit while pressing the locking ring upwards.

7. Hold the insulation washer in place and refit the flange ring. Undo and remount the 8 screws one by one, apply locking fluid (supplied in the kit) and tighten the screws firmly.
8. Turn the lower bearing assembly’s hollow shaft so that the clevis pin hole is aligned with the intended hole in the motor unit flange ring, see fig. 5.7.a. The orientation of the hollow shaft is determined by the flat side of the terminal eye/rigging screw. Use the previously made marker pen marks. Mount the clevis pin through the hole in one side of the flange ring and hollow shaft. The clevis pin is then in position when the hole in the terminal eye/rigging screw is to be found.

9. Loosen the rope and lower the complete drive unit down over the terminal eye/rigging screw. Place a piece of cloth or paper between the lower bearing assembly’s hollow shaft and the extrusion, to protect against scratching the extrusion. Also have cloth/paper between the clevis pin and the extrusion.

10. Mount the clevis pin permanently with the split pin, so that the drive unit is fixed to the terminal eye/rigging screw. See fig. 5.7.a and 5.7.b. Open the split pin 20º.

11. Mount the cable collar and deck collar according to chap. 5.5 and 5.6.

12. Adjust the position of the extrusion so that the marks (made in chap. 5.11) coincide with the lower bearing assembly’s upper edge. Mount the two screws (see fig. 5.11.a) in the black plastic adapter and tighten so that they bottom in the forestay extrusion. Loosen the screws one at a time and apply locking fluid to the threads. Tighten the screws firmly.

13. Feed the protective sleeve with the two supplied hose clamps, over the cables C3. Mount the sleeve on the drive unit cable collar (fig. 5.6). Use a driver with a hex socket intended for hose clamps and tighten firmly.

14. Feed the cables through the deck collar (fig. 5.6) and then fit the sleeve.

15. Attach the cables below deck. Cut the cables to the correct length and connect to the plinths in the connection box. See chap. 4.6.

16. Check that the supplied emergency furling equipment can be mounted on the starboard side of the drive unit and then remove it again. See chap. 7.6.

---

Test the supplied emergency furling equipment and then remove it again.

Before test-running the unit, tie or tape the tack hook to the extrusion so that the hook does not strike the drive unit and damage it. Also check that the emergency furling equipment is disconnected.
6. **TD** Installation of motor unit on TD (Furlex for below-deck installation)

**Preparation**

**NF** For installation of the lower bearing assembly in the boat, refer to instruction 595-231-S (Instruction for Furlex 200 TD & 300 TD).

**EP** If a toggle or extension link is used between the fork and the boat’s chain plate, it must be able to withstand the torsional forces created by the Furlex system. See table 3.2.1.

Check that the boat’s forestay attachment is strong enough to take up the torsional forces from the Furlex Electric. Since there is no furling line to take up the torsional forces when, e.g. sailing with a reefed foresail, all of the torsional forces will be taken up by the drive unit and be transferred via the toggle to the boat’s forestay attachment. See table 3.2.1 for the minimum torsional capacity of the forestay attachment.

The strength can be theoretically calculated or found via practical tests.

If the chainplate is not sufficiently strong, there are 4 threaded holes on the underside of the motor unit to which a torque absorber can be fitted. This must be individually adapted for the boat in question and is therefore not supplied by Seldén.

**EP** In order to install the motor unit on the lower bearing assembly, this must be removed from the boat. The sail must also be removed.

The connection box is mounted in the anchor box, as in chap. 4.6.
6.1 Checking the motor unit

1. Temporarily connect the motor unit to the connection box.
2. Activate the power supply from the battery and turn on the control current.
3. Test run both IN & OUT functions.
4. If the functions are OK; remove the cables from the connection box. If not, fault trace according to “Fault tracing diagram”, Chap. 9.

6.2 Disassembly of the line guide unit

1. Roll off all the line from the line drum.

2. Fig. 6.2.a

3. Fig. 6.2.b

Undo the screws ②, and release a few turns on screw ③. Lower the line guide fitting and release it.

4. Fig. 6.2.c

Press in the spring loaded clips (arrow 1) and release the locking block downwards.

5. Turn the line drum protector a half turn and pull it off the line drum.
6.3 Disassembly of the line drum

1. Disassemble the line drum halves.

![Fig. 6.3.a](image)
Push a screwdriver under one of the drum’s “quick connectors”. Push in another screwdriver between the drum halves on the same side so that these are pressed apart 3-4 mm.

![Fig. 6.3.b](image)
Keep the screwdriver in place and turn the stay a half turn. Release the other drum half’s “quick connection”.

The line drum halves can now be removed.

6.4 Releasing the forestay

1. Slacken the backstay as much as possible. But make sure that any rigging screw is not unscrewed so far that the threads are no longer visible “on the inside”.
   For masts with aft swept spreaders, the upper rigging screw must be slackened so much that the forestay can be disconnected. E.g., slacken the backstay + one upper rigging screw, Count the number of turns the rigging screw is slackened. This simplifies reassembly.
   Avoid changing the setting of any Furlex rigging screws. This simplifies reassembly.

2. Draw the top of the mast forward with the genoa halyard. Secure the halyard using a “D” shackle or tie it to a strong deck fitting. For safety reasons, do not use the halyard snap shackle.

![Avoid changing the setting of any Furlex rigging screws.](image)

3. Mark the position of the extrusion against the adapter tube top with i.e. a lead pencil. This simplifies later reassembly. Undo the screws holding the extrusion to the adapter tube. See fig. 6.4.a.

4. Undo the two bushes that connect the adapter tube to the lower bearing assembly. Note! Loosen the smaller locking screw before the larger socket cap screws are released.

5. Move the adapter tube up along the extrusion to expose the forestay toggle. Place a piece of cloth or paper between the adapter tube and extrusion to protect against scratching. Secure the adapter tube in this position with tape.

6. Secure the locking pin in the lower end of the lower extrusion with tape. See fig. 6.4.b.

7. Disconnect the forestay by removing the toggle’s lower clevis pin. Tie the forestay to a cleat or the pulpit until it is time for reassembly.
6.5 Mounting the motor unit

In order to mount the motor on the existing lower bearing assembly, it is necessary to partially disassemble it.

1. Prepare the motor unit by removing the flange ring (8 pcs socket head screws) and plastic insulation between the flange ring and motor unit. See fig. 6.5.a.

2. Release the lower bearing assembly from the boat’s chain plate and lift it up through the deck collar.

3. Start by loosening both the locking screws . and then remove the fork termination.

See fig. 6.5.b. (On an existing Furlex TD both the locking screws are sealed with locking fluid).

4. Place the lower bearing assembly upside down (preferably in a box, to collect the ballbearings) and remove the locking ring that holds the washer and ball-bearings in place.

See fig. 6.5.b. On reassembly, the locking ring will be replaced with a new one supplied with the kit.

5. Remove the washer, balls and bearing race. Clean the washer and bearing race for later refitting.

6. Mount the two flanges on the lower bearing assembly as illustrated. Note that the longest flange keys should point toward the top of the lower bearing assembly. See fig. 6.5.c.

Now try to feed the motor unit over the bearing assembly so that the keys engage in the grooves. Lift off the motor unit and secure the flanges with tape.

Due to variations in manufacture, certain older lower bearing assemblies can have a slightly larger outer diameter, which prevents the flange from entering fully. In such cases, remove one of the flanges and try again. If this does not work either, then the flange must be modified to a suitable shape with a file.

7. Undo the deck collar screws but leave it in place.

8. Place the motor unit under the hole in the deck. Lower the lower bearing assembly down through the deck collar and onto the motor unit. Align the flange keys in the grooves in the motor unit.

9. Secure the motor unit with a rope to prevent it falling down.

10. Apply a little grease to the bearing race and feed it down onto the lower bearing assembly. Then mount the bearing cage with supplied bearings in the grease. Make sure that no balls are missing. (Any lost ball bearings can be replaced with old disassembled ball bearings.) Note that the bearing cage is conical and that the “narrow” end shall face upwards and enter the bearing race. See fig. 6.5.d.

11. Mount the washer and the new supplied locking ring. (Never re-use an old locking ring). In order to ensure that the locking ring bottoms in its groove, lift the motor unit a little while at the same time pressing the locking ring upwards.

12. Install the plastic insulating washer and the flange ring. Install the 8 screws and tighten moderately. Undo and refit the 8 screws one by one, apply locking fluid (supplied with the kit) and tighten the screws firmly.

13. Refit the fork termination. Apply a little locking fluid to both the locking screws and then refit them. See fig. 6.5.b.
14. Remount the lower bearing assembly on the boat’s chain plate. When the toggle is mounted on the chain plate, the maximum number of shims should be placed in between to reduce the play. The Furlex Electric-kit is supplied with 4 (four) 0.8 mm shims. Fit the shims as evenly as possible on each side of the boat’s forestay attachment (e.g. 2+2 or 1+1).

15. Apply locking fluid to the two screws ⑤ that hold the motor unit to the lower bearing assembly and fit them. See fig. 6.5.e. (The assembled lower bearing assembly and motor unit will hereafter be called the “Drive unit”).

16. Refit the deck collar with the four screws. If these screws do not have hexagonal heads, they should be replaced with ones that do. The limited space between the deck and drive unit does not allow the use of other tools than ring spanners and adjustable spanners.

17. Refit the forestay according to Furlex TD instruction 595-231-S. Chap. 16.6-16.8.

18. Check that the supplied emergency furling equipment can be mounted on the starboard side of the drive unit. See chap. 7.6.

---

Test the supplied emergency furling equipment and then remove it again.

### 6.6 Connecting to the connection box

1. Fit the supplied protective sleeve ① to feed the cables (C3) from the drive unit cable collar temporarily ② to the connection box ③. See fig. 6.6.a. Note that the sleeve must be arched so that movement of the drive unit can be taken up without the sleeve being stretched. After the toggle has been shimmed in place, there can still be a certain amount of play, the drive unit will twist a few degrees depending on whether the sail is furling or unfurling.

2. Mark the cutting point on the sleeve.

3. If the sleeve forms a lowest point ④ between the drive unit and connection box, a draining hole must be made ⑤ (approx. Ø 10), for any condensation to escape from. Mark the draining hole on the sleeve.

4. **Pull the sleeve off the cables**, cut to the correct length and make the draining hole.

5. Fit the protective sleeve and the supplied hose clamp of the two cables. Mount the sleeve on the drive unit cable collar. Use a driver with a hex socket intended for hose clamps and tighten firmly.

6. Fasten the sleeve under the decking ⑥, but be sure to make sufficient allowance for movement according to point 1. Cut the cables to the correct length and connect to the plinths in the connection box. See chap. 4.6.

---

Before test-running the unit, tie or tape the tack hook to the extrusion so that the hook does not strike the drive unit and damage it. Also check that the emergency furling equipment has been removed.
OPERATING INSTRUCTIONS

In order for you to gain the most benefit and enjoyment from your Furlex Electric system, we recommend that you study these operating instructions thoroughly. Some sections may refer to “Instructions for Furlex 200 S & 300 S” (595-104-S).

All safety-related information is indicated by the following symbol:  

⚠️ This information must be followed to avoid damage to the system and the risk of personal injury. The guarantee conditions apply only with correct operation in accordance with these instructions.

Note that the electric motor in the Furlex E is not intended for continuous operation under high loading. The temperature of the electric motor increases significantly when furling under heavy loading, e.g. very heavy winds, or with heavy resistance from the sheet when furling. For this reason, do not furl and unfurl the sail repeatedly during such conditions.

Furlex users who have not personally installed the Furlex system do not need to read the entire installation instruction. The operating instruction do however, refer to selected parts of the installation instructions. It is very important that these instructions are read and observed.
7 Sailing with Furlex Electric

7.1 Setting the sail

Refer to “Instruction Furlex 200 S & 300 S” (595-104-S). Chap. 11.1.

7.2 General information about furling

Using electric power removes some of the sensation of resistance or friction when furling & unfurling. One should therefore always keep an eye on the furling process and ensure that no external obstacle hinders the process and causes damage.

The current to the motor is limited electronically. If one does not slacken the sheet sufficiently when furling, the motor will be overloaded and the current will be cut automatically. When the IN or OUT button is released, the current protection is reset automatically after a few seconds. One can now continue furling/unfurling, but has received a warning that the load is too high. Read more about current limitation in chap. 1.3 “Control box”.

7.3 Unfurling

1. Turn the control current on.
2. Release the weather side of the genoa sheet. Place it so that it can run free during unfurling.
3. Place the lee-side sheet one turn around a winch and tension by hand.
4. Press on the control button/remote button GENOA OUT and pull on the lee-side sheet at the same time. The button should be held depressed during the entire unfurling process.
   The best bow for unfurling is upwind. One can then take up the slack on the lee-side sheet and thus ensure that the sail does not flap too much.
5. Lay another turn of the sheet around the winch and adjust the sail to the desired shape.

7.4 Furling

1. Free up the weather-side sheet and make sure it can run free.
2. Release the lee-side sheet from the cleat or winch self-tailer. Hold against the sheet while at the same time reducing the number of turns around the winch so that only one remains.
3. Furl in the sail on the Furlex-extrusion by pressing the control button/remote button GENOA IN. Slacken the lee-side sheet as you go, so that the sail is evenly and firmly furled. A sail that is too loosely furled can blow out in hard winds. If the boat is left unattended, the sail can flap apart. A sail that is too loosely furled can also cause unnecessary wear when the sail rocks back and forth in the wind.
   If the resistance in the sheet is too great when furling, the motor will be overloaded and the current will be automatically cut. Release the control button/remote button, slacken the sheet and then press on GENOA IN again.
4. Then switch off the control current so that no unintentional maneuvering can be performed.

7.5 Reefing

Refer to “Instruction Furlex 200 S & 300 S” (595-104-S). Chap.12, applicable sections. The process of manoeuvring with the furling line is replaced by manoeuvring with the control button/remote button.
Do not use Furlex E to sheet with.
7.6 Emergency furling

If, for any reason, the electrical function ceases to work (See Fault tracing diagram, chap. 9.) the Furlex Electric system can easily be operated by using the supplied emergency furling equipment. This equipment is connected to the drive unit via a ½” square fitting on the drive unit’s starboard side. See fig. 7.6.a.

On the Furlex E, some of Seldén’s ¼” crank handles for electrically operated furling masts also fit. If the length of the crank handle interferes with e.g. the pulpit, an extension can be used. E.g. from a socket wrench set with ½” drive. The ½” crank is available in two lengths, as extra equipment. (Order no., see chap. 2.4).

1. Turn off the control current.
2. Connect the emergency furling equipment ① by mounting the square fitting of the central shaft ② into the drive unit’s base ③. The bottom of the base has an M6 thread. Fasten the emergency furling equipment to the drive unit with the screw/plastic knob ④.
3. Furl or unfurl the sail by pulling on the short continuous line ⑤.

The emergency furling equipment (or crank) must never be connected when the system is operated electrically. It would rotate very rapidly when the electric motor started, with a great risk for personal injury or damage to property.

The emergency furling equipment or crank must never be connected when the system is operated electrically. It would rotate very rapidly when the electric motor started.
8 Care & Service

In order for your Furlex Electric system to function both mechanically and electrically and to rotate easily, year after year, a certain amount of system maintenance is required on a regular basis. This care and service chapter is a complement to chapter 15 in “Instructions for Furlex 200 S & 300 S” (595-104-S).

8.1 Every week

Furlex Electric is designed to withstand a saltwater environment. However, it should be washed down with fresh water occasionally, e.g. when the deck is washed off. This also applies to a Furlex TDE located in the anchor box. Also check that the anchor box drainage functions satisfactorily and that the outlet is not blocked. A Furlex TDE is especially exposed if the box is filled with water.

8.2 Every year

Check for wear of the toggle (see instruction 595-104-S, chap. 15).

Lubrication of the lower bearing assembly (see instruction 595-104-S, chap. 15.1).

Lubrication of the halyard swivel (see instruction 595-104-S, chap. 15.2).
The ball bearings are lubricated with Furlex-grease, which is supplied with the Furlex Electric kit.

Cleaning, etc. with de-rigging (see instruction 595-104-S, chap. 15.3).

Electric cables, protective sleeve and connection box
Inspect the protective sleeve, connection box and cables (C3) between the Furlex Electric unit and the connection box. Damaged protective sleeves and defective hose clamps must be replaced.
If the connection box is damaged by the anchor chain or similar, it must be replaced.

Remote control (extra equipment)
Replace the battery in the remote control hand unit. Make sure you have a spare battery onboard. For further information, see chap. 4.8.4.

8.3 Every 5th year

The reduction gear in the drive unit is lubricated with lithium-based grease (SKF LGEP 2/04). With normal use, the unit should be left to an authorised Seldén dealer for service at a maximum of 5 year intervals. Such a service includes disassembly and cleaning, replacement of seals, O-rings and drive belt, and re-greasing.

For boats that are used for chartering, long-distance sailing, etc. the unit should be left for service more frequently.

8.4 Storage

Furlex Electric drive unit
Should be flushed free from salt and dirt. The Furlex Electric drive unit can be easily removed from the forestay extrusion for separate storage, which is recommended. Move the drive unit upwards along the extrusion when being removed, see chap. 5.2.5. Store in a dry, well ventilated area. Always turn the hose ends downwards, so that water cannot run in and damage the electric motor, etc.
If the drive unit is stored on the forestay extrusion together with the mast, remember that the Furlex Electric drive unit is considerably heavier than a Furlex S lower bearing assembly. Fix a board or similar along the mast, for the extrusion and drive unit to be attached to. See fig. 8.4.a. Alternatively, the Furlex system can be removed from the forestay extrusion and be pushed up along the mast.

![Fig. 8.4.a](image)

Note that the protective sleeve for the cables must ALWAYS be facing downwards, to prevent water and dirt entering. See fig. 8.4.b.

![Fig. 8.4.b](image)

A Furlex TDE can be stored over winter onboard the boat. The boat is covered and the anchor box cover should preferably be left open to ventilate the space.

⚠️ **Under no conditions may a Furlex Electric be stored in a tightly-fitting package. It must be stored in a dry, well ventilated place.**

**Forestay and extrusion**
These can preferably be stored together with the mast (see instruction 595-104-S, chap. 15.4).

**Remote control** (extra equipment)
Store the remote control hand unit in a dry place with the battery removed. Remember to fit a new battery at the start of the new season! For further information, see chap. 4.8.
9 Fault tracing diagram

The manual will be upgraded with fault tracing diagram during fall 2008. To take part of this upgraded version go to our website www.seldenmast.se or contact our service dealers.
10 Spare parts list

The manual will be upgraded with spare parts list during fall 2008. To take part of this upgraded version go to our website www.seldenmast.se or contact our service dealers.
The Seldén Group is the world’s leading manufacturer of masts and rigging systems in carbon and aluminium for dinghies, keelboats and yachts.

The Group consists of Seldén Mast AB in Sweden, Seldén Mast A/S in Denmark, Seldén Mast Ltd in the UK, Seldén Mid Europe B.V. in the Netherlands, Seldén Mast SAS in France and Seldén Mast Inc in the USA. Our well known brands are Seldén and Furlex. The worldwide success of Furlex has enabled us to build a network of over 750 authorised dealers covering the world’s marine markets. So wherever you sail, you can be sure of fast access to our service, spare parts and know-how.
